The spirits of the wicked are waiting in the Chamber of the Eye. They appear as red eyes, like blood, from which they eat away. A twisted lock of hair at the neck of the victims. Their names engraved on the floor. All figures are carved in solid wood and finished in a realistic style. The height of the figures is about 26 cm. Natural anti-inflammatory plant extracts with bioactive compounds against experimental colitis. Inflammatory bowel diseases (IBD) are chronic relapsing inflammatory disorders characterized by intestinal inflammation and bowel epithelial damage. The etiology and pathogenesis of IBD are not clearly understood, but studies have suggested a potential role for the intestinal microbiota in these processes. Indeed, the experimental use of antibiotics, metronidazole, or VSL#3 (a probiotic) in animal models has demonstrated a reduction in intestinal inflammation. A large amount of experimental data support the participation of the microflora in IBD and, in this context, the use of probiotics seems to be a promising therapeutic strategy for this disease. However, the high rate of adverse events associated with antibiotic therapy has led researchers to explore alternatives to antibiotics for the management of these diseases. Many studies have explored the anti-inflammatory potential of natural products, in particular plants, which have been used for centuries in the treatment of IBD. The efficacy of these natural products is related to the presence of several bioactive compounds, among them flavonoids and phenolic compounds. These phytochemicals may act synergistically, through various mechanisms, such as the inhibition of pro-inflammatory enzymes and the modulation of immune responses. Some extracts of natural origin have been shown to exhibit anti-inflammatory activity in the animal models of colitis. However, the mechanism by which they exert their effects on inflammation has not been elucidated, and this is an important gap that requires filling. The aim of this review is to summarize the effect of some extracts of natural origin with bioactive compounds against experimental colitis.
